

INDUSTRIAL CAMERAS

Industrial rear-view camera systems increase productivity and safety on site

REAR-view camera systems are a vital safety feature for both workers and vehicle operators at mine sites, eradicating blind spots to prevent vehicle damage, avoid human injury and improve overall productivity. Importantly, they are no longer limited to 'rear' view; enhanced vision protection is now available for whole of vehicle solutions. With a comprehensive range and knowledge, Safety Vision Systems Australia has the right solution for a range of specific requirements.

Established in 1984, SVS has developed a range of industrial camera systems which are the most advanced and comprehensive on the Australian market.

SVS' quality-assured products are ideally suited to the harsh conditions of the Australian mining industry.

There are very few products on the market that undergo the same level of destructive testing as with the SVS range; the company's camera system range is tested and retested as part of the manufacturing process to ensure it meets the stringent quality required.

While SVS provides kits options to suit mining applications, its range can be tailored to suit specific customer applications.

The SVS range is supported by the company's technical and product support team which is continually updating its knowledge to meet the demands of the marketplace.

For more information interested parties can contact SVS to see how it can improve safety and productivity on mine sites.
